

NexHire AI - Business Model Canvas

Designed for: Smart Employee Recruitment & AI Hiring System | Designed by: Aarian Kumar and Shivani | Version: Final

Key Partners • AI/NLP model or API providers for semantic skill matching, scoring and text generation. • Cloud hosting & MySQL database service providers for the web app, MySQL database and AI services. • Google/Outlook Calendar APIs for interview scheduling and synchronization. • GitHub for version control, team collaboration and CI through GitHub Actions. • Future LinkedIn/Indeed partner APIs: job board posting is simulated in the FYP because live access is restricted.	Key Activities • Develop and maintain the HR panel, candidate portal and end-to-end recruitment workflow. • Create/manage vacancies and vacancy-specific structured application forms using generic from mechanism. • AI application evaluation, requirement fulfillment scoring, ranking and semantic skill matching. • Duplicate candidate detection and Strong Match / Possible Match / Not a Fit tagging. • Interview scheduling, interviewer assignment, private feedback capture and AI-assisted feedback analysis. • Generate role specific interview questions and AI drafted offer letters. • Hiring analytics, reporting, bias/fairness auditing, testing, deployment and documentation. Key Resources • React.js frontend, Node.js/Express backend and MySQL relational database. • AI services with n8n or LangGraph workflow orchestration. • Structured vacancy requirements and candidate application data. • Development team expertise in web technologies, databases and AI/ML. • Cloud infrastructure, Docker, Git/GitHub repository and Figma prototypes. • AI/NLP APIs/libraries and sample job/application data for testing.	Value Propositions • One centralized, traceable hiring pipeline from vacancy creation through screening, interviews and offer generation. • Consistent candidate comparison through vacancy-specific structured forms instead of scattered CVs, emails and spreadsheets. • Faster screening through AI requirement-fulfillment scoring, ranking and semantic skill matching. • Duplicate-applicant flagging plus clear Strong Match / Possible Match / Not a Fit categories. • Integrated interview scheduling, private feedback, candidate status tracking and hiring analytics. • AI assistance for interview questions, feedback insights, candidate FAQs and offer-letter drafting while final hiring decisions remain with HR. • Bias/fairness auditing to support transparent and accountable AI-assisted screening.	Customer Relationships • Self-service candidate portal for registration, vacancy browsing, applications and status tracking. • HR Admin dashboard for vacancies, applications, interviews, offers and reports. • AI chatbot for candidate recruitment FAQs. • Automated scoring and status visibility to reduce repetitive manual communication. • Secure role-based access, traceable records and private HR feedback. • Ongoing support and product updates for a future commercial deployment. Channels • Responsive web platform for HR teams and candidates. • Organization career pages and vacancy links directing candidates to structured application forms. • Direct B2B demonstrations and organizational onboarding for HR departments and recruitment agencies. • Simulated LinkedIn/Indeed job-board syndication in the FYP, with future partner API integration. • Google/Outlook Calendar integration for interview scheduling.	Customer Segments • Corporate HR departments that recruit staff on an ongoing basis - primary commercial customers. • Recruitment agencies and recruitment web-portals handling high applicant volumes or multiple clients. • Startups and SMEs without a dedicated Applicant Tracking System (ATS). • Organizations across IT, Education, Finance, E-commerce and Manufacturing. • University career services and campus recruitment drives. • Candidates are important platform users/beneficiaries, but organizations are the paying customer segment.
Cost Structure • Cloud hosting for frontend, backend, database and AI microservice. • AI/NLP API, model or compute costs for scoring, matching and generation. • Development, testing, maintenance, security and deployment effort. • Database storage, backups and infrastructure scaling as application volume grows. • Third-party integration and future partner/API costs where applicable.		Revenue Streams • For a future commercial version, a plausible model is B2B SaaS subscription fees paid by organizations using NexHire AI. • Possible subscription tiers may vary by vacancies, recruiter seats, applicant volume or AI usage. • Optional setup/customization, enterprise integrations or premium AI/analytics services may provide additional revenue. • These revenue items are business model assumptions for commercialization, not committed FYP features.
